

Pasteurized human milk: nature's best medicine

With the right nutrition and antibodies, pasteurized human milk promotes growth, boosts immune systems, and protects babies from infections when mom's own milk is unavailable.

- ◆ Recommended for babies to avoid serious sickness, chronic illnesses, and even go home from the hospital sooner
- ◆ Carefully processed in the state-of-the-art lab at the non-profit Mid-Atlantic Mothers' Milk Bank following FDA and state guidelines
- ◆ Can serve as a bridge to a parent's breastfeeding success

The mother of all nutrition.

Pasteurized human milk is recommended for medically fragile infants, premature babies and some well babies when mother's own milk is unavailable, as it improves outcomes.

State-of-the-art safe

Milk from the Mid-Atlantic Mothers' Milk Bank is carefully processed and pasteurized in the lab using the latest technology to ensure that critical nutrients remain while bacteria and viruses are destroyed. The milk is tested for bacteria, drugs, and nutrition before it goes to the hospital in specially prepared bottles.

Parents helping parents

Milk comes to the milk bank from volunteers, who are healthy and have more milk than their own baby needs. Only after a parent is thoroughly screened, including blood testing, can they donate milk. Some volunteers begin donating their milk after their own babies received pasteurized human milk in the hospital.

Mid-Atlantic Mothers' Milk Bank

Proudly inspected and accredited by the Human Milk Banking Association of North America.
